

Sticky Notes Django Fix Report

Problem 1:

The Django app would not start because the shell was using the wrong Python interpreter.

Running `python manage.py runserver` returned `ModuleNotFoundError: No module named django`.

Problem 2:

After the server started, the homepage still failed because the root URL `'/'` was not mapped to the notes app.

Django returned a Page not found error at the homepage.

Problem 3:

The notes database tables were missing, so the notes page could not render properly.

The app raised an `OperationalError` for the `notes_note` table.

Fixes applied:

1. Started the project with the workspace virtual environment at `.venv/Scripts/python.exe`.
2. Added a PowerShell launcher script, `start_server.ps1`, to make future launches consistent.
3. Updated `sticky_notes/urls.py` to route the root path `''` to the notes URLs.
4. Added `ALLOWED_HOSTS` entries for `127.0.0.1`, `localhost`, and `testserver`.
5. Created and applied the missing migration for the Note model.
6. Added a regression test to confirm the homepage loads successfully.

Result:

The application now runs successfully at `http://127.0.0.1:8000/` and the homepage responds correctly.
